INTRODUCTION

History

The lighting master plan was commissioned as a result of campus community concerns

- Safety and perceived security concerns raised in campus safety walks
- Maintenance concerns by campus staff given the variety of lighting equipment and consumables
- Sustainability concerns
- Aesthetic concerns by Board of Visitors and others about lighting fixtures selected for newer capital projects.

Process

Public work sessions:

A series of public work sessions were commissioned with stakeholders throughout the university. Discussions primarily centered around:

Public safety - areas of concern, times of concern, types of issues (quality of life, perceived security, actual endangerment).

Environmental - energy usage, dark skies, light trespass and glare

Maintenance - lamp/ballast life, luminaire life cycle, stocking, repair and retrofit

Aesthetics - luminaire styles, lamp color and color rendering.

Priorities – Areas of particular opportunity and concern
Goals:

*Based on these discussions a number of goals were established:*

Create a few standards for illuminance of new walking, parking, driving and assembling areas based on what is working now and recommended practice.

Develop a family of lighting fixtures that are flexible, appropriate and unique to the areas of campus, that allows the facilities department to stock fewer parts and pieces.

Prioritize problem areas and areas of opportunity

Provide safe places for recreation

Identify areas of visual interest that can be highlighted at night

Campus lighting survey

*As a part of this study, the lighting consultant surveyed the existing lighting conditions around the main campus.*

**Fixture types** - Over 28 different exterior lighting fixture styles exist on the main campus and College Hill

**Exterior electric light levels** in some places that exceeded 25FC, well above normal exterior levels

**Extreme non-uniformity** of illuminance in many places

**Disability glare** from non-cutoff wallpacks, floodlights, unshielded bollards and canopy lights

**Light Levels / uniformity** – some areas that are working well. Especially the West End Residential District and newer projects at College Hill

**Areas of concern** – Several areas exist where visibility is low, including the Historic Mall

**Culture and lifestyle** – Students cluster densely in areas with adequate lighting and avoid the central areas of campus that are inappropriately lighted.

**Campus character** - During the day several areas of open space are used for recreation and activities that might be better utilized at night

**Illustrated guide and priority list**

Based on the goals and findings, a two-step draft review process was commissioned for this campus lighting masterplan.

**Updating university design guidelines**

Based on this master plan, the existing campus guidelines will be updated to provide future designers clear direction on implementation of these strategies

**Design considerations as a part of overall master plan (Summary)**

This master plan is intended to support and provide specificity to the Overall Campus Master Plan developed concurrently by the Smith Group

Lighting Master Plan

Guiding Principles

Visibility – For reasons of safety, security and campus image, night time visibility is to be facilitated.

Safety - Lighting along paths and crossings shall allow easy navigation by pedestrians. This is created by having proper horizontal illuminance at grade.

Security – While lighting can not directly make areas more secure, it shall increase the perceived security by providing managed vertical illuminance on faces.

Natural surveillance – So that pedestrians are not intimidated by potential loiterers, lighting shall be judiciously designed to afford surveillance of areas near buildings and in tucked-away areas from a comfortable distance. This does not mean lighting every area, but rather using architecturally sound lighting to provide natural views of concealed areas. It also means lighting paths and vertical surfaces so that loiterers in off-path areas are seen in silhouette (at least), so they do not surprise pedestrians at close proximity.

Disposition awareness - At close proximity, soft vertical lighting of good color quality shall allow pedestrians to see clothing and faces accurately and also, in case of an incident, allow for proper identification of subjects

Contrast ratios – In order to increase visual acuity without using excess energy, careful control of uniformity and maximum illuminances shall be adhered to in future projects. Because pedestrians’ visual systems are highly adaptable, increasing uniformity and eliminating excessive brightness will increase perceived brightness.

Glare control – In order to control contrast ratios, fixture glare must be controlled. All lighting equipment shall be evaluated for its glare potential.

Light pollution (uplight) – Light that does not contact surfaces and people is wasted. In order to minimize this waste and the impact of lighting on the night sky, all lighting equipment shall be evaluated for its uplight component. Special attention shall be taken to eliminate light emitted between 90° and 160° above nadir that contributes principally to light pollution.

Light trespass – Lighting that impacts adjacent properties unintentionally should be eliminated. Special attention should be given to potential trespass of lighting into dormitory rooms as it may impact sleep cycles of occupants.

An energetic campus – Lighting shall emphasize what makes the campus an interesting, compelling and energetic place after dark. Areas of focus, gathering and visual interest shall be addressed so that campus has lighting that matches its vibrancy.
Vision

Light and night visibility

The human visual system is highly adaptive. We can see during the peak of summer sunlight and in very low light levels. This adaptation occurs over time. If we exit a dark theater into daylight, our system is shocked because we do not have time to adapt comfortably. Given time, the visual system can adapt to luminances ranging from daylight to starlight. In most after-dark environments, we are adapted somewhere in between. This state of vision is known as mesopic, where the low end of the cone photoreceptors and high end of the rod photoreceptors are stimulated. In this range, the key to visual acuity is not actually the absolute level of luminance, but rather the proper sequence of lighting levels and uniformity. It is important that members of the campus community not experience very high light levels adjacent to very low light levels. By keeping luminance uniform, we eliminate the need for excessively high light levels; saving energy and reducing light pollution and trespass.

Sequencing

(See Table 02-01 for referenced illuminance guidelines)

Consider a student leaving class in Howell Science after dusk when the lighting plan has been implemented. By limiting light levels in the corridors to 15FC average, the student has time to transition from interior task lighting levels that are typically around 45FC. This is a comfortable adaptation of 3:1 (45FC:15FC). By the time the student has adapted to the 15FC, she is leaving the building. If the building entrance/exit is illuminated to an average of 5FC, then she again experiences a comfortable 3:1 adaptation. This exit transitions to a primary path that has an average of over 2.6FC (extrapolated from 0.75FC min. 6:1 uniformity). When she arrives at White Hall she has a similar adaptation back to interior levels.

Likewise consider a theater patron arriving from 5th Street via automobile. The street lighting level averages about 0.5 FC. In the parking lot north of Messick,
the average illuminance is 1.6FC (0.25FC min. 12:1 uniformity extrapolated). He adapts to the building entrance of 5FC average before entering the theater lobby at about 15FC average. Vertical lighting of the facade and interior elements reinforce wayfinding; guiding him toward the building.

**Vertical lighting**

Because horizontal lighting is reduced, it becomes even more critical that lighting on vertical surfaces is carefully considered. Low-glare vertical light on faces is crucial to perceived security. Also vertical light on objects of interest, facades and from inside buildings provides visual interest and rhythm to the campus experience.

**Focal elements**

Successful facade lighting at Whichard Building and Joyner Library are examples of lighting that provides focus and visual rhythm to the campus. There are a number of other opportunities for similar explorations of architectural detail in new and existing projects on campus. The judicious use of facade lighting is encouraged. Discrete facade lighting reinforces major architectural forms and features without floodlighting large portions of the building or surrounds.

**Building evidence**

Light exiting through building glazing must also be considered as a part of the facade. Excess brightness from interior lighting is not allowed. Interior fixtures near fenestration, light transmittance of glazing and interior lighting strategies must be carefully considered.

**Lighting for permanent works of art**

Works of art, particularly sculpture is found throughout campus with a concentration along the perimeter of the Historic Mall. Works of art considered permanent by the university should be treated with lighting specifically designed for the works. A combination of pole mounted, on-grade and in-grade key and fill lights should be employed to emphasise form, material and meaning of the work.

**Proposed design for rotating art locations**

Because the University has a vibrant visual arts program, several pieces of art are displayed on a temporary basis around campus. If the university provides set locations for these pieces, it would help organize the visual experience, help maintenance crews by removing art from lawn areas and provide a better showcase for the works. It is proposed that concrete pads be provided with integral anchor points and lighting to encourage the organized presentation of temporary art installations and to provide additional visual interest at night.

**Lighting for landscape features**

Lighting for important landscape elements will also add to the after-dark character of the campus. Specimen trees and other important elements at hubs and axis of campus paths should be illuminated with on-grade or in-grade fixtures as appropriate.
PROPOSED ART UNGRADE PEDESTAL
WITH INTEGRATED LIGHTING
Tiered Paths

Parking and play areas shall follow IESNA RP-33-98, provide adequate light for visual acuity and safe transit and occupation.

Secondary paths shall be lighted to IESNA standard levels for enhanced security.

Primary path routes shall be lighted with greater uniformity to clearly define them as arteries and encourage connectivity and traffic flow.

Legend

- Tier 1 - Primary Paths
- Tier 2 - Secondary Paths
- Tier 3 - Parking & Play Areas
Gathering Places

Activity Areas

Areas near recreation zones and student centers shall have additional lighting to support activity. Lighting shall be controlled by astronomic timeclock and be on during normal operating hours and off or at reduced levels when closed.

Areas for Play

Additional lighting for areas near residential zones shall be provided during select hours and for special events. Lighting shall be controlled by electronic timer with integral astronomic time clock and shall either be turned on manually by students or by University Staff and shall turn off automatically after a prescribed period or at an established curfew whichever occurs first.
Focal Objects and Campus Character

A rhythm of focal objects exist clustered at central campus. The lighting at the Cupola, the Fountain, and Whichard and Joyner facades are the starting point for a campus full of interesting vertical items that should be highlighted at night.

As additional pieces of sculptural, landscape and architectural interest are added, focal lighting should reflect a radial pattern emanating from the Historic Mall and extending to the outer points of campus.
Luminare Families
Refer to District Boundaries in Overall University Master Plan

West end and College Hill Residential Districts

- This fixture matches existing lighting fixtures in residential districts. Fixture generally controls glare well and provides good uniformity.
- Type: CL1
- Basis of Design: Hadco “Small Techtra” Series
- Lamp: Philips MHC150/C/U/3K/ALTO
- Luminaire mounting height: 12'

Historic Mall

- This fixture speaks to classic lines around campus. This fixture is architecturally appropriate for pastural areas. The fixtures for the Mall area will have a slightly more ornate pole and fitter as appropriate for green space and is indicative of early 20th century lamp-posts
- Type CL2A
- Basis of Design: Sentry Electric “SWB-NS Estate” Series
- Lamp: Philips MHC150/C/U/3K/ALTO
- Luminaire mounting height: 12'
- Existing original gas fixtures to be removed and saved for possible use at piers and campus entrances and areas immediately adjacent to Fifth Street

Central Campus

- This fixture matches that of the historic mall, but is less ornate and, thus less expensive. Simplified pole and fitter fits with more architectural styles
- Type CL2B
- Basis of Design: Sentry Electric “SWB-NS Estate” Series
- Lamp: Philips MHC150/C/U/3K/ALTO
- Luminaire mounting height: 12'
Driveways and parking adjacent to buildings

- Matches outlying parking fixtures in smaller scale
- Type CL3 Series
- Basis of Design: Hadco PA31 Series
- Other acceptable models: Kim “Archetype” Series or LITHIONIA “AERIS” Series
- Lamp: Philips MHC150/C/U/3K/ALTO. Equivalent l.e.d. sources are encouraged where life-cycle cost analysis prove payback over the system life
- Luminaire mounting height: 20’. Fixtures on poles over 12’ may only be located in areas easily accessible by bucket truck or scissor-lift for maintenance

Outlying parking areas

- Simple softened shoebox type fixtures that perform well and are unobtrusive in the landscape
- Type CL4 Series
- Basis of Design: Hadco PA31 Series
- Other acceptable models: Kim “Archetype” Series or LITHIONIA “AERIS” Series
- Lamp: Philips MS400/C/U/PS. Equivalent l.e.d. sources are encouraged where life-cycle cost analysis prove payback over the system life.
- Luminaire mounting height: 30’. Fixtures on poles over 12’ may only be located in areas easily accessible by bucket truck or scissor-lift for maintenance
- Where fixtures must be located within paved sections of parking areas, they shall be located at the intersection of striped patterns and include no less that a 30” tall concrete base extending above the grade.

South driveways (Ninth Street extension) and parking

- Type CL5 Series
- Basis of Design: Kim “Curvature” Series

Existing fixtures to be maintained until end of useful system life.

Equipment guidelines

- Pedestrian scale post-top luminaires are to be provided by the university to projects at a cost to the project. The type of decorative luminaire is determined by the district in which the project is constructed.

- Bollards are strongly discouraged for path lighting due to potential for glare, lack of usable vertical light on faces and difficulty of maintenance. Where illuminated bollards must be used as a part of a building design, they shall not be the principal means of path illuminance.

- Acceptable lamps: Philips CMH35/T6/830, PL-T32W/830. Equivalent i.e.d. or induction sources encouraged where life-cycle costs analysis prove payback over the system life.

- Use of in grade fixtures is discouraged. Any considered must be equivalent of IP67 and aimed at objects in a manner that reduces spill light and glare. In-grade fixtures may only be used in hardscape or lawns where mulch and other planting materials will not impede the operation and maintenance of the fixtures. They shall be no more than (within 1/2") above grade to avoid creating a tripping hazards. They shall not be installed at the low-point of adjacent grades where they may become de facto drains. All conduit entry points must be sealed properly with RTV silicone or similar and installed and drained properly according to the manufacturer’s recommendations. Basis of Design: BK Tenya, HP2 or CO2 Series

- On grade landscape lighting may be used in planting beds, but not in or near lawns or pathways where they may cause a tripping hazard and complicated lawn maintenance. For durability, on-grade fixtures shall be machined from a solid billet of copper-free aluminum, brass or stainless steel and be IP66 rated or higher and be anchored to remain rigid and watertight when kicked or similarly impacted. Basis of Design: BK Artistar Series

- Judicious façade lighting is encouraged. Use ASHRAE 90.1.2004 for guidance on maximum lighting power density. Acceptable lamps: Philips CMH35/T6/830, CMH70/T6/830, CMH150/T6/830, MHC150/C/U/3K/ALTO, PL-T32W/830. Equivalent i.e.d. or induction sources encouraged where life-cycle costs analysis prove payback over the system life. All fixtures shall be IP66 Rated or better.

- Non-cutoff wall-packs may NOT be used unless lamp is cutoff by a physical structure in a manner that prevents view from normal angles

- Unshielded canopy lights may NOT be used. Lights at buildings shall reduce glare by shielding light source from view from pedestrian paths by baffle or other means of control. All building mounted lighting shall be easily accessible for maintenance

- Where ever possible, ballasts matching campus stock shall be specified

- Catenary type pedestrian scale lighting may be used if approved as a part of the building design

- BUG (Backlight, Uplight, Glare) Rating as defined by IESNA TM-15-07 Addendum A shall not exceed B2-U2-G2 except when mounted near residence halls or perimter of campus when B0 is required
Implementation

Finalization and procurement strategies for new campus standard lighting fixtures

As a part of Lighting Project 2 the relighting of Historic Mall. Samples of each fixture being considered for Type CL2A shall be purchased and installed. Feedback will be solicited from the university community before final selection is made. The final selection for project shall be considered the campus standard CL2A fixture and this document updated to reflect the selection.

In order to allow the university to create a standard family of lighting fixtures, yet still allow open competition. Fixtures shall be considered the university’s preferred brand for the purposes of bidding future projects.

Priorities

Many of the prescriptions included in this plan are meant to be implemented as a part of capital projects over time. However, there are several areas that need to be addressed as specific lighting projects due to safety concerns, scope that would not be included in capital projects, and/or problems that are fairly serious that need to be addressed.
Maintainance projects as systems are replaced

- Glare control of existing fixtures
- Replace non-cutoff wallpacks with full-cutoff versions
- Use shields or replace canopy lights
- Remove building mounted area lights that emit light over 45 degrees above nadir (straight down) and replace with appropriate site lighting
- Upgrade light sources to 3000K ceramic metal halide, led or fluorescent as appropriate per fixture usage and life-cycle cost analysis.
